Abstract. This research examines how different parenting styles affect children's behavioral outcomes. Using a cross-sectional study design, data was gathered from parents and teachers to assess children's behavior in relation to parenting practices. The study identifies significant differences in behavioral outcomes based on parenting styles, highlighting the importance of parenting in child development.

Keywords: Parenting Styles, Child Behavior, Developmental Psychology, Cross-Sectional Study, Parenting Practices

Introduction

Parenting styles are a critical factor in shaping children's behavioral development. The authoritative, authoritarian, permissive, and uninvolved styles each have distinct impacts on children's behavior. This study investigates these effects through a cross-sectional approach, gathering data from both parents and teachers to evaluate children's behavior. The analysis reveals notable variations in behavioral outcomes associated with each parenting style, underscoring the role of effective parenting strategies in promoting positive child development. These findings contribute to the understanding of how parenting influences child behavior and development.
