**Abstract.** This article investigates how different parenting styles influence child behavioral development. By conducting interviews and observational studies, we identify correlations between parenting approaches and child behavior. The findings underline the importance of supportive and nurturing environments in fostering positive behavioral outcomes in children.

**Keywords:** parenting styles, behavioral development, child psychology, family environment, observational study

## **Introduction**

Parenting styles play a crucial role in shaping child behavioral development. This study aims to explore the impact of various parenting approaches on child behavior through comprehensive interviews and observational studies. We identify significant correlations between parenting styles, such as authoritative, authoritarian, and permissive, and child behavioral outcomes. Our findings suggest that supportive and nurturing parenting fosters positive behavioral development, emphasizing the importance of creating healthy family environments. These insights are valuable for parents and educators seeking to understand the dynamics of child development.
