Abstract. This research investigates phonological variation in urban dialects, focusing on the influences of social factors and migration. By studying dialects in major metropolitan areas, the study uncovers patterns of phonological change and variation. The findings enhance our understanding of how urbanization and social dynamics influence language variation and contribute to the development of new dialect forms.

Keywords: phonological variation, urban dialects, sociolinguistics, migration, language change

Introduction

Urban dialects are characterized by a high degree of phonological variation, influenced by social factors and migration patterns. This research explores these variations, focusing on how social dynamics and urbanization contribute to the development of new dialect forms. By analyzing dialects in major metropolitan areas, we uncover patterns of phonological change and variation, providing insights into the relationship between language and society. The study offers a comprehensive understanding of the factors driving phonological variation in urban environments and highlights the role of migration and social interaction in shaping language.
